A CLIENT FOUND SEVEN ERRORS IN THE CASE STUDY WRITTEN ABOUT HIS OWN CODE.

SEVEN CORRECTIONS

OT

AI systems testing and verification

HE READ THE WRITE-UP TWICE.

Five of the seven corrections are his: a count of findings that double-counted one item, a closure claim that said more than his own record says, a paragraph about permissions that belonged in the correspondence rather than in the page, and a claim about his specification revisions that was stronger than v0.14 supports. Two were mine, found by re-reading.

MOST OF THEM WERE SMALL.

What mattered was not, because a page that overstates its own accuracy is the same defect it is describing.

THE RECORD EXISTED BEFORE ANY OF THIS: A REGISTER OF 34,757 BYTES, A REVISION HISTORY, AND A RULE THAT A FINDING CLOSES WHEN A FIX IS VERIFIED RATHER THAN WHEN IT IS PROMISED.

Its revision history carries the record of where I was wrong first, which is why he trusted the rest of it.

A REVIEW THAT REPORTS ONLY THE CORRECTIONS IT WAS FORCED INTO IS NOT KEEPING A RECORD.

It is keeping a defence.
