OLUSANYA TIMOTHY

AI Security Researcher | Adversarial AI & Agentic Systems

Lagos, Nigeria | olusanyatimothy54@gmail.com | github.com/Teamthy | linkedin.com/in/olusanya-timothy

SUMMARY

AI security engineer who builds adversarial test infrastructure for LLM and agentic systems and treats reproducibility as the deliverable. Released an open-source red-team harness and writes a public 21-part series on failure modes in shipped AI. Work is built around instrumented experiments, provenance, and findings a stranger can re-derive from the raw output.

SELECTED RESEARCH ARTIFACTS

- ai-redteam-five-tests (open source, on my GitHub profile): a runnable red-team harness that runs five reproducible failure checks against any OpenAI-compatible model: prompt injection, poisoned retrieval, tool-description injection, multilingual refusal, and failure-rate metrics with the sample size beside every rate. Ships the method, not pre-baked results : raw responses and counts are written out so a finding is re-derivable.
- Breaking AI (public, 21-part, article 1 October 2026): documents reproducible failure modes in shipped AI features, with the exact test inputs and the controls that stop them.
- Chatbot pre-launch red team: built an LLM support bot (system prompt, tool wiring), ran six injection tests before launch, four succeeded (system prompt leak, an unauthorized refund commitment, a content policy bypass). Shipped the fixes and turned every finding into a reusable test checklist.

TECHNICAL SKILLS

Languages: Python, Go, TypeScript, JavaScript, SQL

AI / LLM: LLM APIs, prompt engineering, prompt-injection testing, agentic security, tool/function calling, retrieval pipelines, model evaluation, NIST AI RMF

Research methods: instrumented experiments, reproducible evaluation, provenance and attribution, negative controls, behavioral signature analysis

Backend & data: REST APIs, Node.js, NestJS, Go, JWT auth, RBAC, PostgreSQL, MongoDB, Docker, Git

EXPERIENCE

Software Engineer - AI Integration & Red Teaming, Teamart.inc

Lagos, Nigeria | July 2025 - Present

- Build and ship LLM features for client products: chatbots, retrieval pipelines, tool-calling workflows.
- Run pre-launch red teaming (prompt injection, unauthorized tool calls, policy bypass) and deliver prioritized findings with fixes.
- Develop backend APIs in Go and Node.js, owning design through deployment.

Senior Developer, YKAY ConsultingHub

Lagos, Nigeria | Nov 2024 - June 2025

- Led backend development in Go and Node.js across client-facing products.
- Designed REST APIs and multi-role authentication (JWT, RBAC) for systems with distinct permission levels.
- Set modular architecture standards and ran Git-based review workflows.

PROJECTS

- Nigeria LandSecure (Go, Next.js, PostgreSQL): document storage and verification with role-based permissions; fixed concurrency failures under simultaneous verification using controlled transactions and row locking.
- EDUos (Node.js, TypeScript, Next.js): multi-role education platform; fixed an authorization middleware flaw that exposed data across roles, then hardened the access model.

EDUCATION & CERTIFICATIONS

- BSc Computer Science - National Open University of Nigeria | Expected April 2028 (working while enrolled)
- Previous: Medical Laboratory Science (healthcare domain background)

NIST AI Bootcamp (AI Risk & Safety Frameworks) | AI Engineering & Backend Development (Udemy)
